

# Resource Merger Properties

The resource merger provides the following properties:

1. **sling:hideProperties** ( String or String[] )  
With this we can hide a single property or multiple properties of the resource. Using the \* wildcard character, we can hide all the properties.
2. **sling:hideResource** ( Boolean )  
This can be used in the resource node to hide that particular node along with all its children.
3. **sling:hideChildren** ( String or String[] )  
A single child node or multiple child nodes under a resource can be hidden using this property. Using the \* wildcard character, all the child nodes can be hidden.
4. **sling:orderBefore** ( String )  
In this we define the name of the sibling node before which we wish to place this node.

These resource merger properties can be used to modify both the overlaid components as well as extended (overridden) components.
